

eNav 2012

VFR navigation flight planning for Switzerland

Plot your route directly on the digital ICAO map Switzerland, plan altitudes and export a navigation log to use in your flight planning.

eNav is a software for basic VFR navigation flight planning in Switzerland. It lets you plan your route directly on the ICAO map, just as you would on paper, but having all the benefits a software can bring. A 2D profile view, showing the terrain and airspaces along your flight route, and the possibility of showing a 3D view of your trip in Google Earth helps you visualize your flight. You can configure an aircraft and export a

complete navigation log, including the fuel calculation, as an html page. If you prefer to use your own navigation log, eNav can export all relevant data to an Excel sheet.

eNav is completely in English, however since the user interface is kept simple and graphical, most of the items are self-explanatory.

Main features:

- digital ICAO map Switzerland 2012 (digital swisstopo edition)
- switch between full ICAO map or display airspaces and obstacles only
- profile view with terrain and airspaces (CH)
- 3D visualization of flight path in Google Earth
- export navigation log in different formats (excel, html, gpx,..)
- simple & clear user interface (in English)
- for Microsoft Windows
